WEBSITE & PRODUCT CATALOG

NORDEN FURNITURE & LIVING

A premium furniture catalog concept with WhatsApp-assisted customer inquiries and custom-order discovery

Homepage / First View — hero, product categories, service cues, and an illustrative WhatsApp conversation panel.

Project focus Website structure · Product catalog · Category discovery · WhatsApp inquiry journey · Custom-order UX

Portfolio case study | October 24, 2026

The included image is a visual design concept. This document distinguishes proposed functionality from features that have not been implemented or tested in a live environment.

01 | Project Overview

NORDEN Furniture & Living is a premium furniture website and catalog concept designed to make product discovery and direct customer communication work together. The proposed experience supports shoppers who want to compare furniture visually, ask practical questions, and discuss custom options before deciding to purchase.

Business context

Furniture purchases can involve more questions than a typical low-consideration online order: customers may need to confirm dimensions, finishes, stock, delivery arrangements, or customization options. A catalog-led website can organize the product range, while WhatsApp can provide a familiar route for pre-purchase conversations.

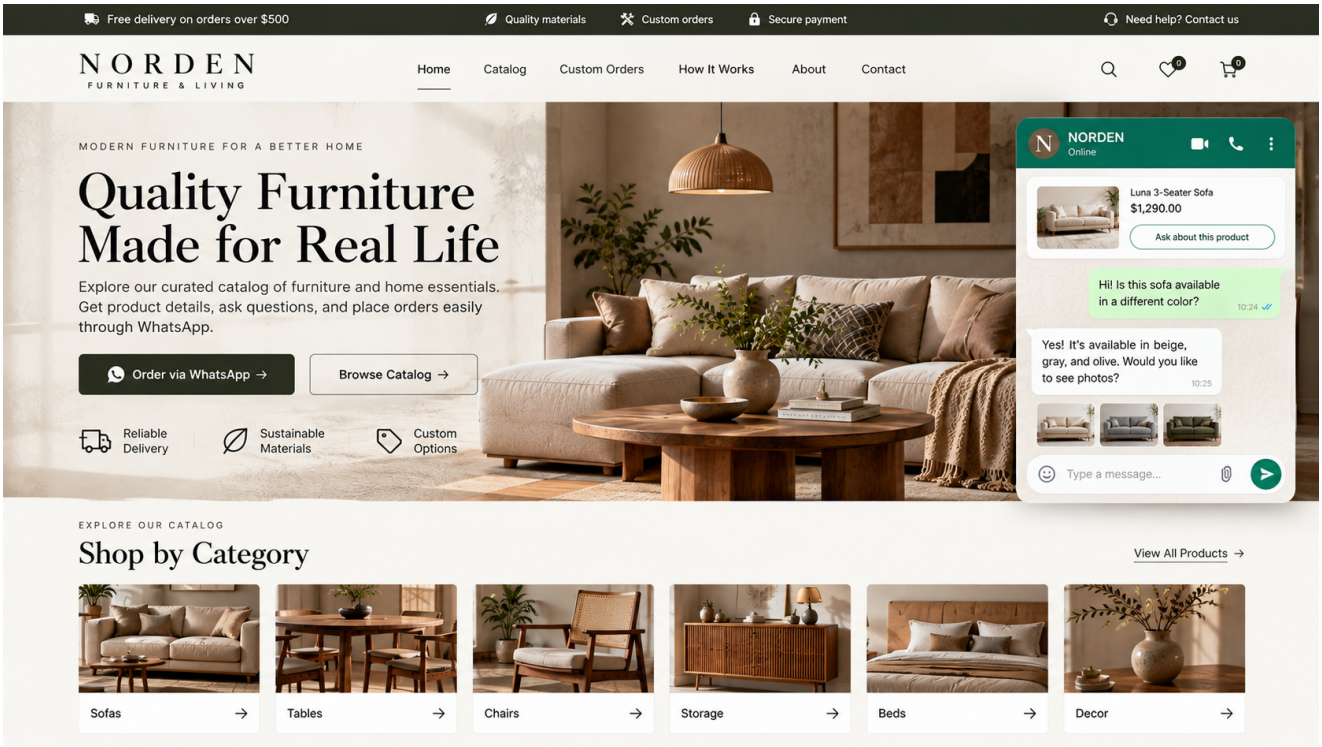

Project objectives

- Present the brand and its product range through a refined, trustworthy storefront.
- Make core categories easy to find and browse.
- Provide clear entry points for product questions and custom-order requests.
- Reduce friction between viewing a product and contacting the business about it.
- Create a scalable design foundation that can be extended with real catalog data and additional pages.

Experience principles

Clarity: direct navigation and obvious next actions. **Product context:** imagery and product-specific inquiry cues. **Continuity:** consistent branding across catalog and contact touchpoints. **Practicality:** the website supports browsing while WhatsApp supports conversation.

02 | Homepage & First View

The main visual combines the brand header, primary calls to action, lifestyle product imagery, a category catalog preview, and an illustrative WhatsApp chat panel.

Header and navigation

The header gives visitors access to Home, Catalog, Custom Orders, How It Works, About, and Contact. Search, favorites, and cart icons are shown as familiar retail conventions. In a production version, each element should be connected only to features supported by the selected build and business workflow.

Hero messaging and calls to action

- **Primary action — Order via WhatsApp:** designed for customers who prefer a direct conversation.
- **Secondary action — Browse Catalog:** sends shoppers toward structured product discovery.
- **Service cues:** delivery, materials, and custom options communicate important decision factors without overwhelming the first view.
- **Catalog preview:** category cards show the range at a glance and provide a natural path into product browsing.

Why this structure works

The first view presents both self-service browsing and assisted sales. Customers who know what they want can explore the catalog, while customers who need reassurance have a visible contact route. The two actions support different buying preferences without competing for attention.

03 | Product Catalog Architecture

The concept organizes furniture into clear categories so shoppers can narrow their search without needing to understand the full product inventory upfront.

Category	Useful catalog fields	Customer question supported
Sofas	Size, seats, upholstery, color, price	Will it fit my space and style?
Tables	Shape, dimensions, material, finish	Which size and finish suit my room?
Chairs	Style, material, upholstery, color	Which chair matches my table or room?
Storage	Width, height, compartments, finish	Does it provide the storage I need?
Beds	Bed size, frame material, finish	Is the size and construction right?
Decor	Dimensions, materials, color, care	How will this item work in my space?

Product-card recommendations

- Use consistent image ratios so the catalog feels organized as customers scan across items.
- Show the product name and price clearly; avoid relying on images alone to communicate product identity.
- Expose meaningful product attributes such as material, dimensions, finish, and available variants.
- Provide a product-specific inquiry action where questions are likely to influence the buying decision.
- Use real stock, pricing, and product details in production; do not publish illustrative values as factual catalog data.

Catalog data model

A maintainable catalog should define a consistent product record: unique identifier, title, category, images, description, price and currency, dimensions, materials, variants, availability, delivery notes, and an inquiry destination. The exact fields should reflect the merchant's products and how the catalog will be updated.

04 | WhatsApp-Assisted Inquiry Journey

WhatsApp is positioned as a communication channel for product questions and custom-order discovery, not as a substitute for a properly configured catalog or order-management process.

Proposed customer flow

Step	Customer action	Website support
1. Discover	Browse categories or open a product	Clear catalog navigation and product cards
2. Ask	Select a WhatsApp inquiry action	Visible contact button with product context
3. Clarify	Ask about size, color, stock, delivery, or customization	Suggested inquiry details and accurate product information
4. Confirm	Discuss options and next steps with the business	Clear expectations for quotes, availability, and response times
5. Order	Follow the business's agreed order and payment process	Documented workflow and secure payment handling

Example product inquiry template

“Hello, I’m interested in the [Product Name]. Could you please confirm availability, available colors or finishes, dimensions, and delivery options? I’d also like to know whether customization is possible.”

Implementation options

- **Click-to-chat link:** a direct link to the business's WhatsApp contact, optionally with a prefilled message. The correct business number and approved link format must be supplied by the merchant.
- **Product-aware inquiry:** each product can pass a product name or SKU into a prefilled message when supported by the chosen implementation.
- **WhatsApp Business operations:** the business may use labels, quick replies, catalog tools, or team workflows if configured and appropriate.
- **Measurement:** track inquiry-button clicks and downstream outcomes only with suitable analytics and privacy practices

Important boundary

The chat panel in the image is illustrative. No live WhatsApp connection, message delivery, account configuration, or automated reply behavior is claimed.

05 | Custom Orders & Service Design

Custom furniture inquiries benefit from a structured intake process. The website can help customers describe their needs before the business prepares a quote or confirms feasibility.

Suggested custom-order intake fields

- Product type or reference item.
- Preferred dimensions and any space constraints.
- Material, color, finish, upholstery, or other relevant options.
- Quantity and intended use.
- Delivery location or general delivery requirements, collected only when necessary.
- Reference images or sketches, if the business can accept and review them.
- Preferred contact method and permission to respond.

Service flow

A clear custom-order flow should explain what happens after an inquiry: review of requirements, confirmation of feasibility, quote and lead time, customer approval, payment instructions, production or sourcing, delivery coordination, and after-sales contact. The exact sequence must reflect the business's real operations.

Trust and expectation setting

- Avoid promising custom options, delivery dates, warranties, or material claims until confirmed by the business.
- Explain whether an inquiry is a request for information or a binding order.
- Keep payment details and sensitive customer information out of informal chat where a secure process is available.
- Set realistic response-time expectations and identify who owns unanswered inquiries.

The benefit

This approach turns a general contact button into a more useful customer journey: customers know what information to provide, and the business receives clearer inquiries that are easier to answer and qualify.

06 | Visual Design & Responsive Experience

The design direction uses warm, tactile furniture photography, generous whitespace, and restrained typography to give the catalog a premium feel while maintaining readable navigation and clear actions.

Design element	Purpose
Cream and warm white	Keep page surfaces calm and let product imagery stand out
Walnut and earthy browns	Connect the digital experience to furniture materials and interiors
Charcoal typography	Maintain legibility and provide strong hierarchy
Muted green accent	Differentiate WhatsApp-oriented actions and communication cues
Editorial serif + clean sans serif	Balance brand character with interface clarity

Responsive considerations

- Collapse navigation into a mobile menu without hiding the catalog or contact path.
- Keep WhatsApp and catalog actions easy to tap, with sufficient spacing between controls.
- Use responsive images and appropriate image compression to avoid unnecessary load time.
- Ensure text remains readable over imagery, with contrast that does not depend on the photograph.
- Test product cards, forms, and chat links on common mobile browsers and devices.

Accessibility considerations

A production build should include meaningful image alt text, keyboard-accessible navigation, visible focus states, accessible form labels, sufficient contrast, and descriptive link names. Icons should not be the only way to identify important actions.

07 | Proposed Technical Implementation Plan

The design can guide a custom website, a CMS-backed catalog, or a platform-based storefront. The final technical choice should follow the client's need for inventory management, editing workflows, checkout, integrations, budget, and ongoing maintenance.

Phase	Activities
Discovery	Confirm business model, audience, catalog size, required pages, custom-order rules, and ownership of product data.
Information architecture	Define category hierarchy, product attributes, page templates, navigation, and contact paths.
Content preparation	Collect approved product photos, accurate descriptions, pricing, dimensions, material details, and policy content.
UI implementation	Build reusable header, hero, category cards, product cards, inquiry buttons, and responsive page sections.
WhatsApp links	Use the business-approved contact number and carefully encoded prefilled inquiry text; test desktop and mobile behavior.
Data management	Choose a manageable method to add, edit, and archive products without creating inconsistent catalog records.
QA and launch	Test links, form validation, responsive layouts, accessibility basics, analytics, privacy notices, and content accuracy.

Platform and integration choices should be validated against current product requirements and the client's existing tools. This concept does not imply that any particular CMS, commerce platform, WhatsApp API, CRM, or payment service has been configured.

08 | Quality Assurance & Success Measures

Before launch, the catalog and contact flow should be tested as a complete customer journey rather than as isolated visual components.

Launch QA checklist

- Verify all navigation, category, product, and contact links.
- Confirm each product's title, price, currency, photos, dimensions, materials, and availability.
- Test WhatsApp links with the correct business contact and product-specific message context.
- Check how the link opens on desktop and mobile, including devices without WhatsApp installed.
- Test inquiry forms, validation messages, success states, and any file-upload behavior if included.
- Check responsive layout, image loading, text contrast, keyboard navigation, and accessible labels.
- Review privacy notice, cookie/analytics behavior, and any personal information collected.
- Confirm the merchant has an operational process for responding to inquiries and recording order status.

Potential metrics

Metric	What it can indicate
Catalog category click-through	Whether visitors find relevant product groupings
Product inquiry button clicks	Interest in asking about specific products
WhatsApp inquiry-to-quote rate	How often conversations progress to a qualified quote
Quote-to-order rate	How often quoted opportunities become orders
Response time	Operational responsiveness to customer questions

These are suggested measurement options, not reported project results. Actual performance should be assessed only after instrumentation is in place and real data has been collected.

09 | Deliverables, Value & Scope Boundaries

Concept deliverables

- Homepage / First View visual for the NORDEN brand.
- Catalog category preview covering sofas, tables, chairs, storage, beds, and decor.
- WhatsApp-assisted inquiry concept integrated into the hero composition.
- Suggested product data fields and category architecture.
- Proposed custom-order inquiry flow and production implementation plan.
- Responsive, accessibility, QA, and measurement recommendations.

Professional value demonstrated

The concept demonstrates an end-to-end way of thinking about a product catalog website: brand presentation, information architecture, catalog usability, direct customer communication, and the operational details needed to turn inquiries into a reliable sales process. It frames the website as a practical business tool rather than only a visual brochure.

Scope and verification

- The image is a generated design concept, not a screenshot of a confirmed live website.
- Product imagery, names, prices, shipping claims, and sample chat content are illustrative and must be verified or replaced.
- No website code, CMS, catalog database, WhatsApp Business account, API, CRM, or payment flow is claimed to have been implemented or tested.
- No conversion improvements, sales growth, or other business outcomes are claimed.
- No customer data or real WhatsApp conversation is represented.

Recommended next steps

- Confirm the client's actual catalog, product data, and brand assets.
- Decide whether the website is inquiry-led, checkout-enabled, or a combination of both.
- Approve the WhatsApp business contact and define who handles incoming messages.
- Implement responsive templates and connect real catalog content.
- Run the QA checklist and measure inquiry quality after launch.

Conclusion

NORDEN Furniture & Living illustrates a considered approach to catalog-led web design with WhatsApp-assisted sales. The visual foundation connects premium product presentation with direct inquiry paths, while the implementation plan highlights the content, data, operational, and quality requirements needed to deliver a reliable production experience.
