Project focus Android UX · Digital menu · Product details · Ordering flow · Store discovery · Customer engagement

Portfolio case study | October 24, 2026

This document describes a visual product concept and proposed implementation approach. It does not claim that a native Android app has been built, published, or connected to a live ordering backend.

01 | Product Vision & Context

Changaya is a Japanese tea house mobile application concept intended to make a traditional tea menu easier to explore and order from a smartphone. The experience connects the brand's atmosphere with practical digital tasks: browsing tea and sweets, reviewing product details, preparing an order, finding store information, and discovering special offers.

Opportunity

A well-structured mobile menu can help customers make decisions before they arrive or while they are on the go. Product imagery supports discovery, concise descriptions answer common questions, and a clear ordering path can reduce the effort required to select items. Store details and customer features can extend the app beyond a static menu.

Design objectives

- Translate the warmth and craft of a Japanese tea house into a consistent mobile visual identity.
- Make tea, matcha, hojicha, and Japanese sweets easy to browse.
- Keep product information and ordering actions close together.
- Provide a clear navigation model for menu, orders, stores, and profile.
- Create a scalable foundation for future ordering, loyalty, and customer communication features.

Core design principles

Calm: restrained color and generous spacing. **Appetizing:** product photography carries the menu experience. **Usable:** predictable navigation and clear buttons. **Extensible:** repeated UI patterns support additional products and features.

02 | Hero Visual & Screen System

The hero image presents the Changaya brand and three smartphone screen concepts within a tea-house setting.

Screen 1 — Launch experience

The first screen introduces the Changaya identity and sets the emotional tone for the app. A production version could use this as a launch or welcome experience, with a direct path into the menu and without delaying returning users unnecessarily.

Screen 2 — Menu catalog

The menu screen uses category filters and image-led product cards to help customers scan the offering. Product name and price appear alongside imagery, while favorites and bottom navigation suggest routes to other app areas.

Screen 3 — Product detail and ordering

The Uji Matcha screen brings the product image, concise description, price, quantity control, and Add to Order action into one view. This pattern can be reused for other menu items, with data fields adjusted to the product type.

03 | Information Architecture

The concept suggests four primary destinations: Home, Menu, Order, Stores, and Profile. Each destination should have a distinct purpose and remain easy to reach from the main navigation.

Area	Primary purpose	Potential content
Home	Orient and engage	Seasonal highlights, popular items, announcements
Menu	Explore products	Categories, product cards, search, filters, favorites
Order	Review order intent	Selected items, quantities, pickup preferences, order status
Stores	Find a location	Address, hours, contact details, map or directions
Profile	Manage customer features	Account settings, saved items, preferences, offers

Navigation recommendations

- Keep the main destinations consistent across primary screens.
- Use text labels alongside icons when needed to improve clarity.
- Preserve a visible path back to the menu from product details.
- Provide empty states for favorites and orders, as well as clear loading and error states.
- Avoid requiring account creation before users can browse the menu unless there is a clear business reason.

04 | Menu Catalog & Product Data

The menu catalog should balance attractive photography with concise, reliable product information. Customers should be able to identify an item quickly and understand its price and relevant attributes before adding it to an order.

Data field	Purpose	Example / consideration
Product ID	Stable reference for cart and backend	Unique identifier independent of display name
Name and category	Supports scanning and filtering	Uji Matcha; Tea; Seasonal
Price and currency	Transparent purchasing decision	Illustrative values in the visual must be verified
Description	Explains taste, ingredients, or serving style	Use approved, accurate product copy
Image assets	Visual discovery	Consistent aspect ratio, optimized files, alt text where relevant
Availability	Avoid selecting unavailable items	Needs a source of truth if availability changes
Options	Supports variants or customizations	Size, sweetness, temperature, or add-ons if offered

Catalog UX details

- Use category labels that reflect how customers think about the menu.
- Keep names and prices readable without forcing users to open every item.
- Make favorite controls stateful and accessible if implemented.
- Support unavailable and seasonal items with clear status labels.
- Use product photography consistently and compress assets for mobile performance.

05 | Proposed Ordering Journey

The visual includes a quantity control and Add to Order action. A complete ordering experience would require additional screens and business rules that are not represented fully in the hero image.

Step	Customer task	Application behavior to implement
1. Select	Choose an item from the menu	Open detail screen and load current product data
2. Customize	Choose quantity or available options	Validate selections and update price where needed
3. Add	Add item to order	Update cart state and provide clear confirmation
4. Review	Check items and total	Show quantities, subtotals, fees, and edit/remove actions
5. Confirm	Choose pickup/time or other supported fulfillment	Validate store, time slot, availability, and order rules
6. Track	Know whether order was accepted and prepared	Return a server-confirmed status and clear updates

Critical business rules

- Determine whether ordering is for pickup, dine-in, delivery, or a supported subset.
- Define how the app handles sold-out products, store closing times, and unavailable pickup slots.
- Ensure totals and availability are validated by the backend before order confirmation.
- Use a reliable order identifier and clear confirmation state; do not treat a button tap as proof an order was accepted.
- Provide error recovery for network interruptions and duplicate submission attempts.

06 | Android Implementation & Architecture Plan

A production Android application would need a maintainable structure separating interface rendering, application state, data access, and external services. The exact architecture and technology choices should be confirmed against the delivery requirements and existing systems.

Suggested layers

- **Presentation layer:** screens, reusable components, navigation, loading states, validation messages, and accessibility semantics.
- **Domain layer:** product browsing, favorites, cart rules, price calculations, pickup constraints, and order state transitions.
- **Data layer:** repositories for menu data, store locations, customer preferences, and order history.
- **Backend/API:** authoritative catalog, availability, order submission, confirmation, and status retrieval.
- **Platform services:** secure session handling, notifications if needed, location permissions only where justified, and deep links.

Integration requirements

- Define API contracts and error responses before implementing connected flows.
- Avoid storing secrets or payment credentials in the mobile client.
- Handle offline and slow-network conditions with clear retry behavior.
- Request permissions only when needed and explain their purpose.
- Keep environment configuration separate for development, testing, and production.

No implementation claim

The hero image demonstrates screen concepts only. No Android source code, API, database, payment provider, push notification service, or production backend is claimed to have been built or connected.

07 | Visual System, Accessibility & Performance

The interface uses tea-inspired greens, warm neutrals, deep brown tones, and photography to evoke the physical tea-house experience. Consistency between screens helps users learn the app without relearning basic controls.

Element	Role in the experience
Deep green	Primary actions and tea-related brand cues
Cream and warm white	Readable surfaces for menu and product details
Dark brown and wood tones	Connects digital screens with the tea-house environment
Editorial typography	Creates a distinctive brand voice while maintaining hierarchy
Product photography	Helps customers visually recognize menu items

Accessibility checklist

- Maintain readable text sizes and sufficient color contrast.
- Provide meaningful accessible labels for icon-only controls.
- Support Android font scaling and system accessibility features.
- Use appropriate touch target sizes and spacing.
- Ensure screen-reader users can understand product names, prices, quantities, and action outcomes.
- Avoid conveying availability or validation only through color.

Performance and reliability

- Optimize product images and avoid loading large assets unnecessarily.
- Use loading placeholders and actionable error states for network requests.
- Keep scrolling and interactions responsive on typical Android devices.
- Test state restoration and behavior during app backgrounding or process recreation.

08 | Testing & Release Readiness

Testing should cover not only the visual layout but also the state transitions and business rules behind browsing, favorites, cart operations, and order confirmation.

Recommended test plan

- **UI tests:** screen rendering, navigation, product cards, quantity controls, empty states, and validation.
- **Domain tests:** cart totals, item quantity rules, option combinations, availability rules, and order state handling.
- **API tests:** catalog responses, authentication if applicable, errors, timeouts, retries, and order confirmation.
- **Device coverage:** multiple Android versions, screen sizes, font scaling, orientation if supported, and network conditions.
- **Accessibility checks:** TalkBack navigation, labels, contrast, and touch targets.
- **Release checks:** app signing, environment configuration, privacy disclosures, crash monitoring, and store listing assets.

Potential success measures

Measure	What it can help evaluate
Menu-to-product detail rate	Whether menu cards help users find items worth exploring
Add-to-order rate	How often product views lead to an order intent
Order completion rate	How often started orders are successfully confirmed
Repeat use	Whether customers return to browse or order again
Crash-free sessions / latency	Reliability and perceived responsiveness

These are suggested metrics, not measured results. Performance and business outcomes should be reported only after a real implementation has been instrumented and evaluated.

09 | Deliverables, Boundaries & Next Steps

Concept deliverables

- Hero visual featuring the Changaya brand and three mobile screen concepts.
- Proposed information architecture for Home, Menu, Order, Stores, and Profile.
- Menu catalog and product detail interaction recommendations.
- Ordering workflow and key business rules to define.
- Android architecture, accessibility, testing, and release planning recommendations.

Scope boundaries

- The included image is a generated visual concept, not a screenshot from a live application.
- Product names, prices, descriptions, and brand assets are illustrative unless separately confirmed.
- No native Android implementation, Play Store release, live ordering backend, payment integration, or store-location service is claimed.
- No measured conversion, retention, revenue, or user-satisfaction outcomes are claimed.
- No actual customer data or order history is represented.

Recommended next steps

- Confirm the real menu, pricing, store details, and ordering model.
- Define required screens, user roles, and the minimum viable product scope.
- Design remaining states: cart, order review, confirmation, errors, empty states, and store details.
- Agree on API contracts and backend responsibilities before implementation.
- Build, test, and validate the Android application on representative devices.
- Prepare store listing, privacy disclosures, and release monitoring if publishing is in scope.

Conclusion

Changaya demonstrates a coherent mobile product direction for a Japanese tea house: an atmospheric brand experience, image-led menu discovery, and a product detail screen designed around ordering intent. The concept provides a practical foundation for detailed UX design and Android implementation, with production readiness dependent on validated menu data, backend behavior, accessibility, testing, and release preparation.
