BEAUTY E-COMMERCE

LUMIA BEAUTY STOREFRONT & CATALOG

A premium multi-category beauty shopping experience with dedicated product and brand discovery pages

Homepage / First View — brand presentation, navigation, service cues, and best sellers.

Project focus Storefront design · Product catalog · Category filtering · Brand directory · Shopping UX

Portfolio case study | October 24, 2026

This document presents visual design concepts and a proposed implementation direction. It does not claim that the storefront is live, deployed, or connected to a production commerce platform.

01 | Project Overview & Goals

LUMIA BEAUTY is a premium beauty e-commerce storefront concept designed to help customers discover and shop skincare, makeup, haircare, body care, fragrance, and curated gift products through a cohesive online experience. The concept pairs refined visual presentation with practical catalog structures and clear shopping paths.

Project objectives

- Create a recognizable beauty retail identity with consistent typography, color, imagery, and page structure.
- Make major product categories easy to reach from the primary navigation.
- Help shoppers scan product cards and compare names, prices, ratings, and other useful details.
- Offer both category-led and brand-led product discovery.
- Provide a reusable design foundation for a production storefront and future catalog growth.

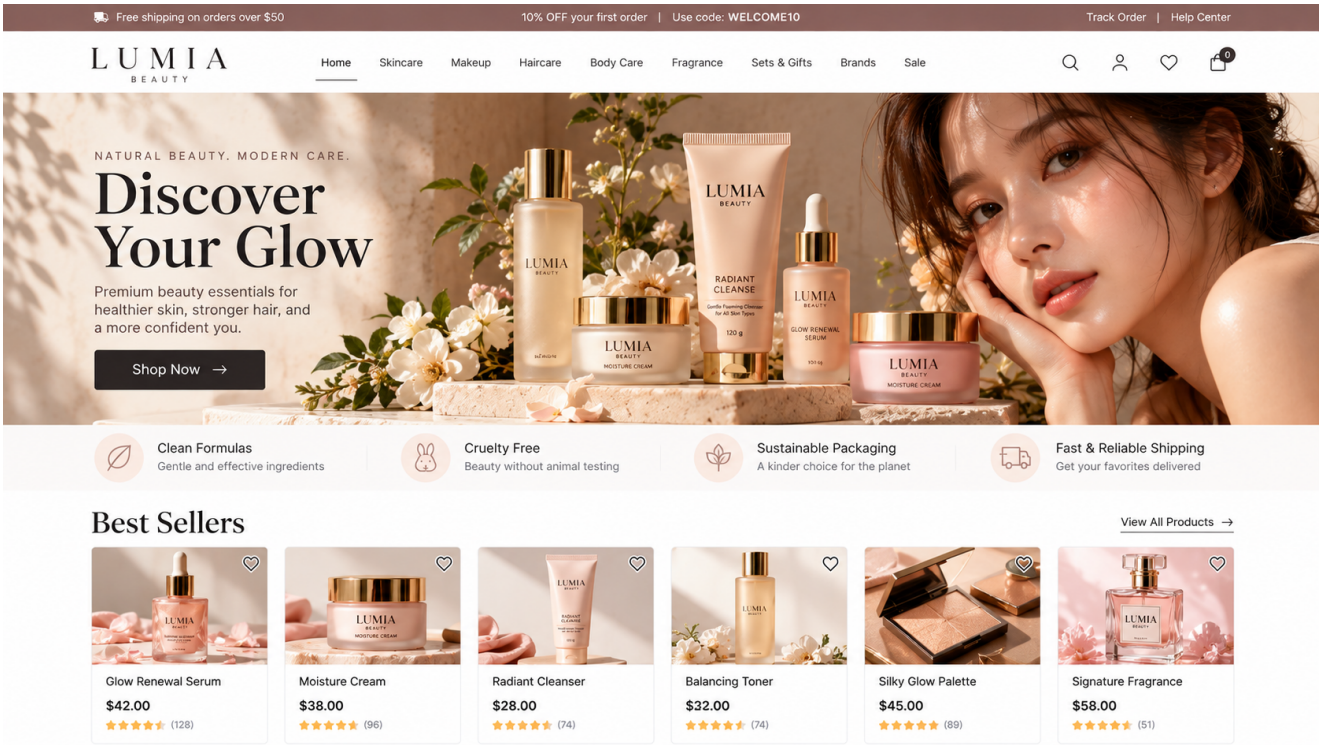

Primary audiences and needs

The concept supports shoppers who arrive with a product need, customers who prefer exploring a category such as Body Care, and brand-loyal shoppers who want to browse by manufacturer. Clear labels and consistent page patterns support these different discovery styles.

Design principles

Elegant: restrained colors and premium photography. **Scannable:** predictable hierarchy and product cards. **Discoverable:** category navigation, filters, and brand links. **Consistent:** reusable patterns across the homepage and specialized pages.

02 | Homepage & First-View Experience

Homepage / First View — brand presentation, navigation, service cues, and best sellers.

Page role

The homepage introduces the brand, highlights key product categories, and gives visitors a clear route into shopping. A prominent hero message and Shop Now action establish the main proposition, while the best-seller section makes specific products available without requiring an extra navigation step.

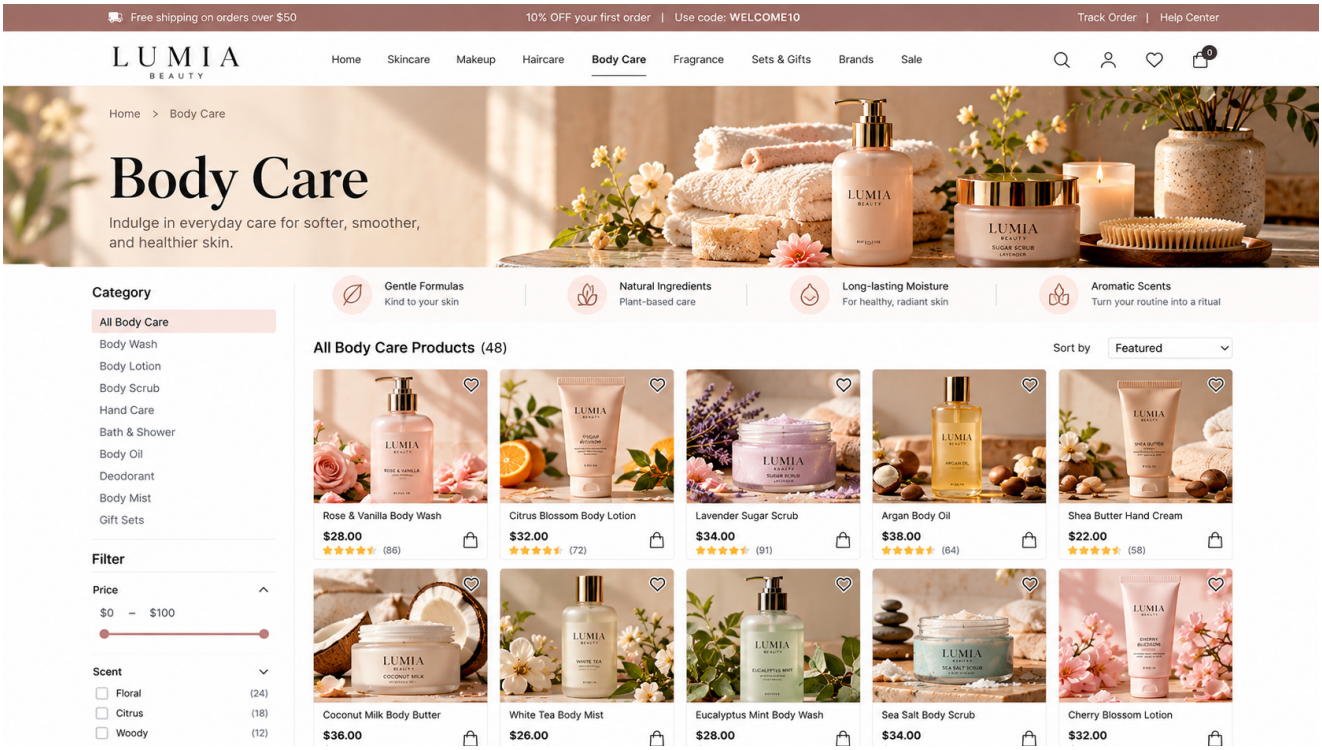

Key interface elements

- **Promotional bar:** space for approved shipping offers, first-order incentives, and customer-support links.
- **Primary navigation:** direct access to skincare, makeup, haircare, body care, fragrance, sets and gifts, brands, and sale.
- **Utility controls:** search, account, wishlist, and cart entry points.
- **Hero area:** product still life, beauty imagery, concise message, and a prominent shopping action.
- **Trust/service strip:** areas for verified product or delivery commitments.
- **Best sellers:** image-led product cards with illustrative prices, ratings, and wishlist controls.

Production considerations

Promotional claims, product reviews, sustainability statements, and shipping thresholds should be verified before publication. A production build should use actual product data and connect search, wishlist, cart, and navigation controls to real functionality.

03 | Body Care Category Page

Body Care collection — category navigation, filters, sorting, and product catalog.

Catalog layout

The Body Care page focuses on product discovery within a defined category. A wide category banner provides context, a left-side navigation and filter area supports refinement, and the product grid allows customers to compare a variety of body-care products.

Category and filter concepts

- **Category navigation:** Body Wash, Body Lotion, Body Scrub, Hand Care, Bath & Shower, Body Oil, Deodorant, Body Mist, and Gift Sets.
- **Price filtering:** a proposed price range control to narrow results.
- **Scent filtering:** floral, citrus, woody, and other options when supported by actual catalog attributes.
- **Sorting:** featured items and other useful sorting modes, depending on platform capability.
- **Product cards:** image, name, price, rating/review display, wishlist, and cart-oriented controls.

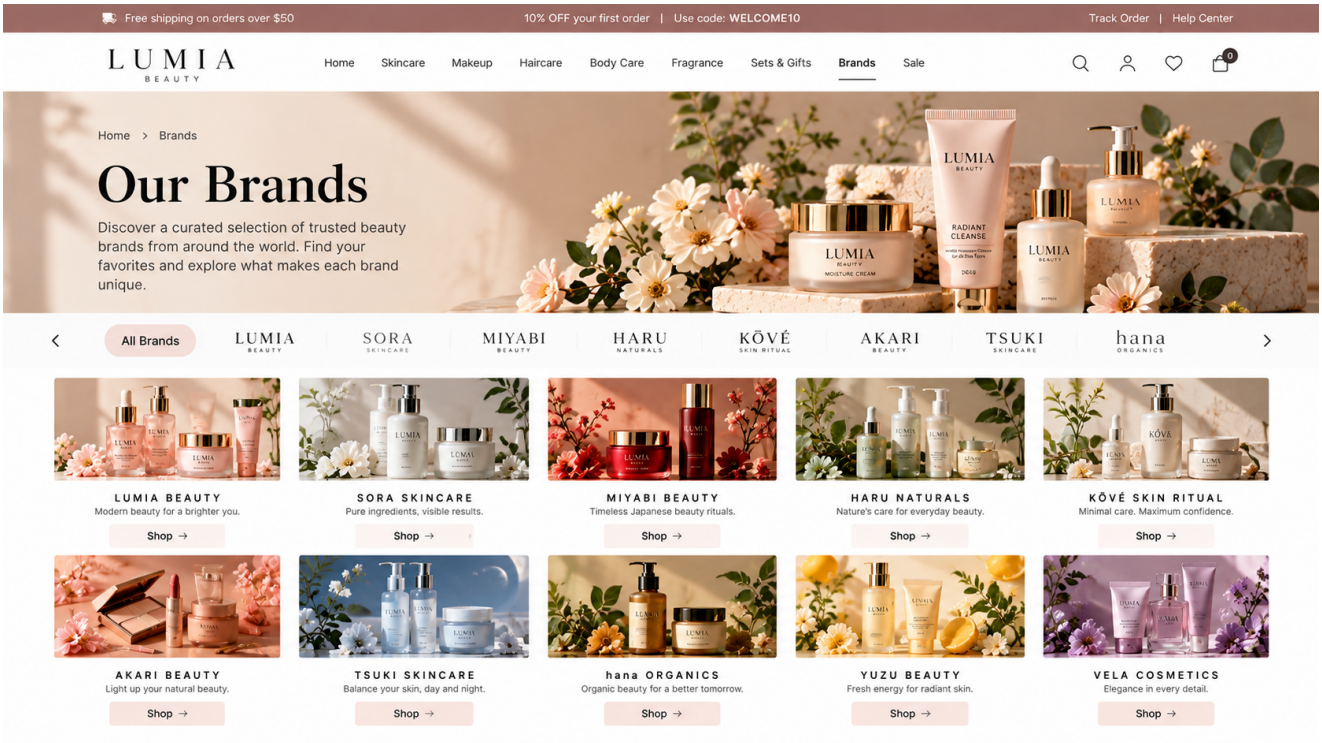

UX rationale

Beauty shoppers often compare products by purpose, ingredients, scent, price, and routine. Category navigation and structured filters can reduce the effort required to find a suitable item, while consistent product cards make scanning easier.

Data and behavior note

Product names, prices, ratings, review counts, and filter counts in the image are illustrative. Functional filters require accurate, structured product attributes and must return correct results.

04 | Brands Directory Page

Brands directory — brand discovery, visual cards, and links into curated collections.

Page role

The Brands directory serves shoppers who already have a preferred label or want to explore the retailer's selection by manufacturer. A dedicated brand index creates an alternative route into the catalog alongside category navigation.

Key interface elements

- **Brand introduction:** explains the curated nature of the retailer's selection.
- **Logo navigation:** offers quick access to selected brands.
- **Brand cards:** product imagery, brand names, concise taglines, and Shop links.
- **Consistent grid:** helps customers compare the available labels at a glance.
- **Collection destination:** each Shop link should lead to a real brand landing page or filtered product listing.

Brand data model

A maintainable directory should store a stable brand identifier, display name, logo or approved image, short description, active status, and the destination URL or collection identifier. The directory should also define behavior for brands with no available products and for newly added or discontinued labels.

Content governance

Brand names, logos, product images, and taglines should be approved for use and kept consistent with the merchant's actual assortment. The example labels in the visual are illustrative.

05 | Customer Journey & Design System

The three page types form one connected shopping experience: visitors arrive at the homepage, browse by category or brand, refine the available products, and continue to a product detail page before adding an item to the cart.

Proposed journey

Stage	Customer intent	Interface support
Discover	Understand the store and product range	Homepage hero, navigation, best sellers
Browse	Explore a category or favorite brand	Body Care page, Brands directory
Refine	Narrow the product selection	Category filters and sorting
Evaluate	Compare relevant products	Product details, prices, ingredients, reviews
Purchase	Add items and complete checkout	Cart, shipping, payment, order confirmation

Visual system

Element	Role
Cream and warm white	Calm backgrounds and readable surfaces
Blush and muted rose	Beauty-oriented accents and promotional highlights
Dark charcoal	Strong text contrast and clear hierarchy
Premium product imagery	Visual recognition and emotional appeal

06 | Proposed E-Commerce Implementation

The visuals can guide a build on a suitable e-commerce platform or a custom storefront. The final implementation path depends on catalog size, merchant editing needs, inventory rules, checkout requirements, integrations, and ongoing maintenance.

Workstream	Scope
Discovery	Confirm target customers, brand assets, product categories, assortment, policies, promotions, and operational requirements.
Information architecture	Define navigation, category hierarchy, brand collections, product attributes, and destination pages.
Catalog preparation	Prepare accurate product titles, images, prices, descriptions, ingredients where applicable, variants, and stock data.
Theme and components	Implement shared header, promotional bar, hero, product cards, category banners, filters, and brand cards.
Commerce configuration	Configure cart, checkout, payments, shipping, taxes where applicable, inventory, and order notifications.
Search and filtering	Map structured attributes to supported search, category filters, and sorting behavior.
Analytics and QA	Validate customer journeys, track agreed events, test responsive behavior, and verify content before launch.

No platform, payment gateway, inventory system, or third-party integration is represented as configured or tested in this visual concept.

07 | Quality Assurance & Measurement

A production storefront should be tested as an end-to-end shopping journey, not just as a set of attractive pages.

Launch checklist

- Confirm every navigation item, brand card, category link, product link, and promotional CTA.
- Verify product names, prices, currency, descriptions, ingredients, images, variants, and stock status.
- Test filter combinations, sorting, pagination or load-more behavior, and empty-result states.
- Validate wishlist, cart, checkout, shipping, payment, and order-confirmation flows.
- Check responsive layouts, keyboard navigation, focus states, image alt text, and contrast.
- Optimize images and test page loading on common mobile and desktop connections.
- Verify promotional terms, shipping claims, reviews, and sustainability statements before publication.
- Check analytics events and privacy disclosures where tracking is used.

Potential success measures

Metric	What it can indicate
Category click-through	Whether visitors find useful product groupings
Filter usage and result rate	Whether catalog attributes support product discovery
Product detail views	Which products attract deeper interest
Add-to-cart rate	How often product exploration leads to purchase intent
Checkout completion	How effectively the checkout converts initiated purchases

These are proposed measurement options, not reported results. No conversion lift, revenue impact, or usability outcome is claimed without a live implementation and real data.

08 | Deliverables, Scope & Next Steps

Concept deliverables

- Homepage visual direction for a premium beauty retailer.
- Body Care category page with product catalog and filter concepts.
- Brands directory with visual brand cards and collection navigation.
- Shared visual language across the three page types.
- Proposed information architecture, implementation workstreams, and QA checklist.

Scope boundaries

- The included images are generated design concepts, not screenshots of a confirmed live store.
- Product names, prices, ratings, review counts, brand labels, and promotional claims are illustrative unless separately verified.
- No storefront code, commerce account, checkout, inventory connection, payment setup, or analytics integration is claimed to be implemented.
- No sales, conversion, accessibility, or performance outcomes are claimed.
- Brand names and visual assets should be checked for authorization and replaced with approved merchant assets before production.

Recommended next steps

- Confirm the actual product assortment, brand permissions, pricing, and merchandising strategy.
- Select the e-commerce platform and map design sections to its capabilities.
- Prepare accurate catalog data and define product attributes for filtering.
- Implement the remaining product detail, cart, checkout, and account experiences.
- Test on desktop and mobile, validate all business rules, and launch with analytics as appropriate.

Conclusion

LUMIA BEAUTY demonstrates a unified concept for a premium multi-category beauty store. The homepage supports brand discovery, the Body Care page illustrates structured category shopping, and the Brands directory offers a manufacturer-led browsing path. Together, the visuals and implementation plan provide a practical foundation for a production storefront, subject to verified catalog data, platform configuration, responsive development, and end-to-end testing.
