STOREFRONT & CUSTOMIZATION

LUMIÈRE HOME & LIVING

A premium Nuvemshop storefront concept for a contemporary home and lifestyle brand

Project focus Storefront structure · Category page design · Product discovery · Shopping UX · Customization planning

Portfolio case study | October 24, 2026

This document presents a visual design concept and proposed implementation direction. It does not claim that the pictured storefront is live, deployed, or integrated with a production Nuvemshop account.

01 | Project Overview

LUMIÈRE HOME & LIVING is a premium homewares storefront concept created to demonstrate how a curated retail brand can present products through a cohesive, customer-oriented online shopping experience. The design uses warm neutrals, natural textures, restrained typography, and lifestyle imagery to support a calm and recognizable brand identity.

The concept is organized around three connected views: a homepage that introduces the brand and major collections, a Home Decor collection page that supports focused browsing, and a Furniture collection page that extends the same design system to larger-ticket products.

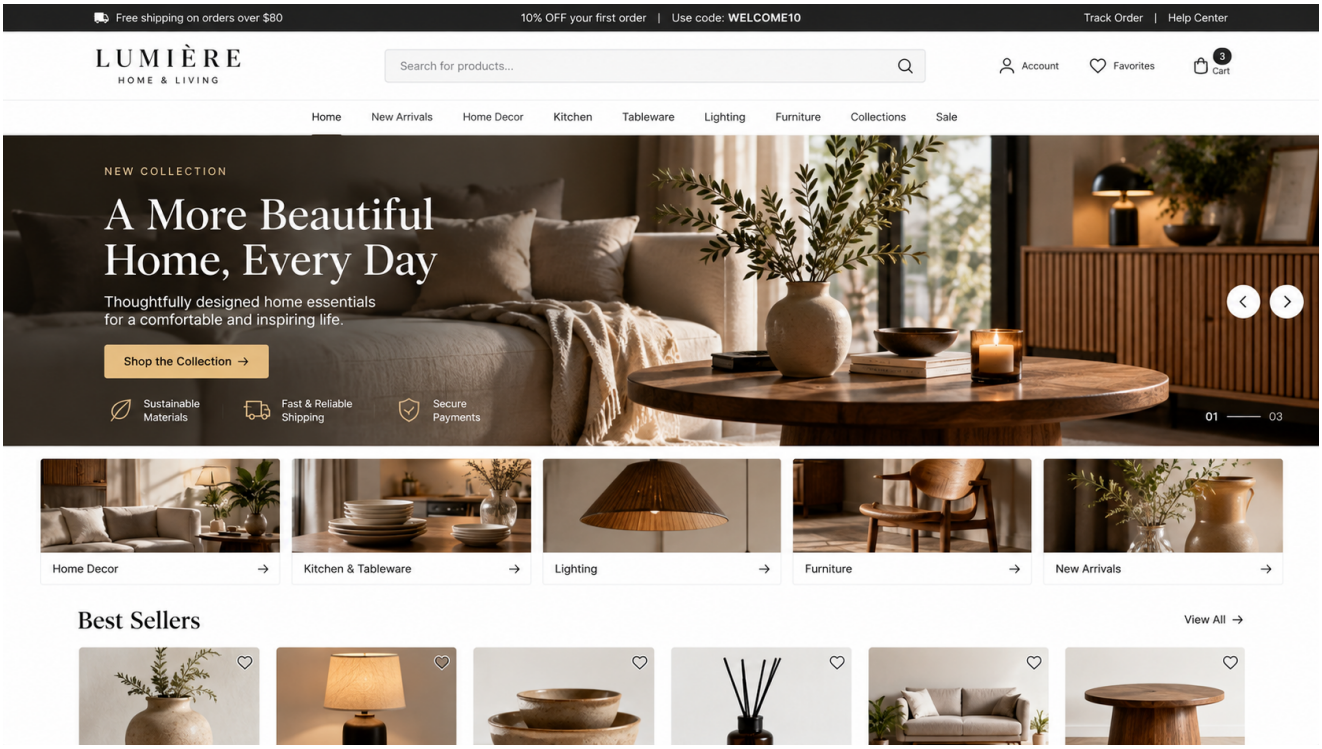

Objectives

- Create a clear entry point for shoppers with a recognizable brand header and structured navigation.
- Make category browsing and product comparison feel consistent across different product types.
- Present product information and shopping actions close together to reduce friction in the browsing-to-purchase journey.
- Establish a reusable visual direction that could guide theme customization and future storefront expansion.

Design principles

Clarity: visible navigation, distinct product groupings, and predictable page structure. **Consistency:** shared typography, spacing, product-card patterns, and warm color palette. **Discoverability:** category links, filters, sorting, and product cues. **Commerce readiness:** interface patterns for search, favorites, cart, and Add to Cart actions.

02 | Homepage Experience

Homepage concept — brand presentation, navigation, featured collections, and best sellers.

Page role

The homepage acts as the primary brand and discovery hub. It introduces the store's visual language, gives customers quick access to major departments, and uses featured collections and best-selling products to create clear next steps.

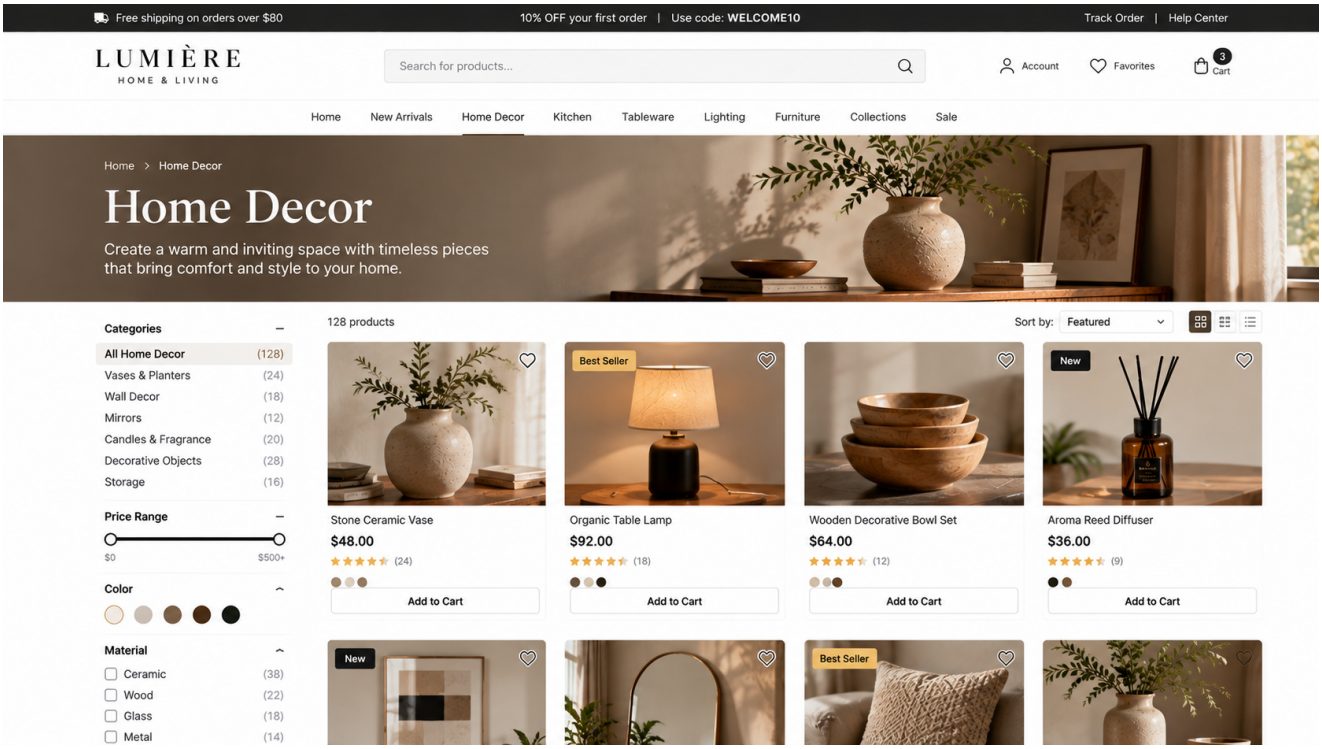

Key interface elements

- **Promotional strip:** a compact space for shipping thresholds or first-order messaging.
- **Brand and utility header:** logo, product search, account, favorites, and cart entry points.
- **Primary navigation:** direct access to Home, New Arrivals, Home Decor, Kitchen, Tableware, Lighting, Furniture, Collections, and Sale.
- **Hero section:** an editorial lifestyle image, concise brand message, and prominent collection CTA.
- **Collection and best-seller modules:** visual shortcuts that help customers move from brand inspiration to specific products.
- **Trust messaging:** proposed areas for shipping, materials, and secure-payment reassurance, subject to operational verification.

Implementation considerations

In a production build, the header, navigation, collection tiles, and product cards should use the platform's real catalog and navigation data wherever possible. Promotional statements and trust claims should be confirmed by the merchant before publication. The desktop composition should also be adapted and tested at tablet and mobile breakpoints.

03 | Home Decor Collection

Home Decor concept — category hero, filters, sorting, and product grid.

Browsing structure

The Home Decor page is designed for shoppers who already know the general type of item they want, while still leaving room for visual discovery. A category banner provides context, followed by a compact filter column and a product grid.

Featured catalog patterns

- **Category list:** All Home Decor, Vases & Planters, Wall Decor, Mirrors, Candles & Fragrance, Decorative Objects, and Storage.
- **Filtering concepts:** price range, color, and material.
- **Sorting and view controls:** a featured sort option and grid/list presentation choices.
- **Product cards:** product image, name, price, rating/review presentation, promotional badge, color swatches, favorite control, and Add to Cart action.
- **Product grouping:** a consistent card structure supports quick scanning across multiple decor styles.

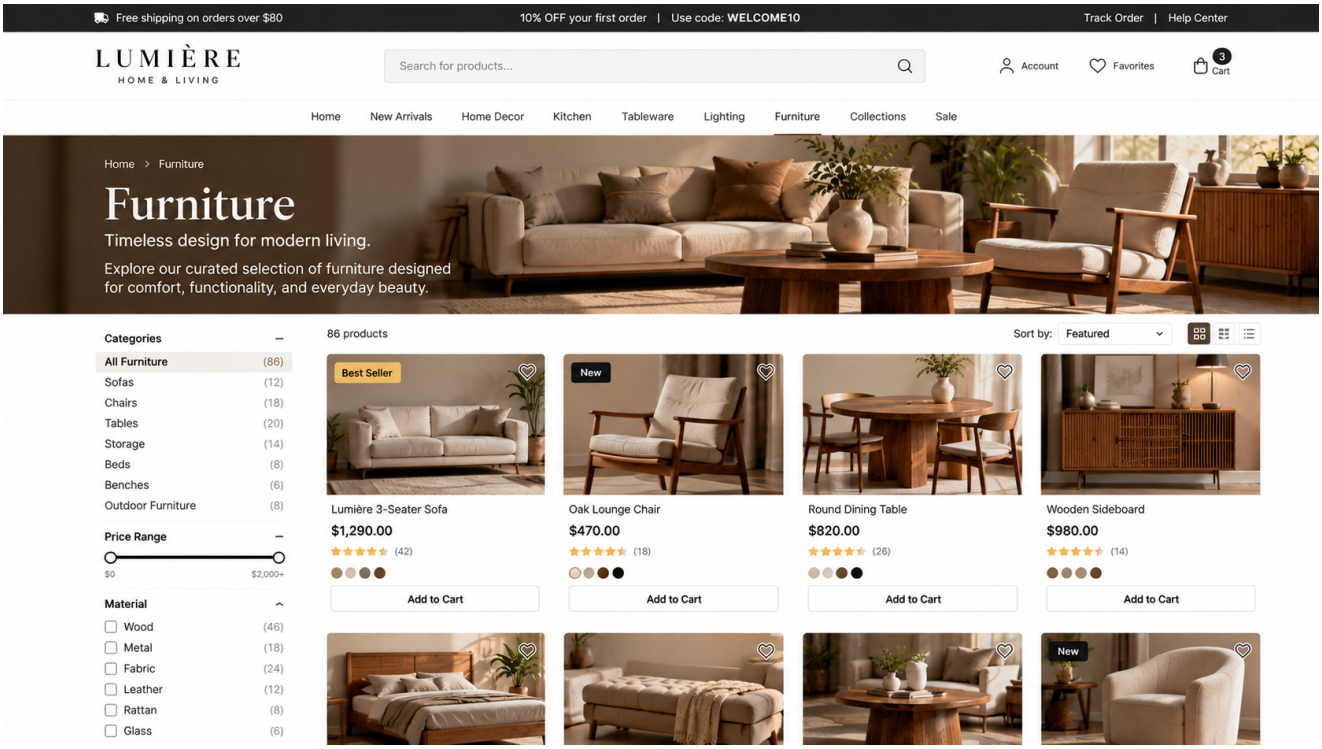

UX rationale

Decor products are often selected through visual preference, finish, and material. The concept therefore gives photography a prominent role while keeping the product name and price visible below each image. Filters provide a proposed way to narrow the collection without overwhelming the page.

Data and functionality note

The displayed product counts, prices, ratings, and badges are illustrative visual content. A live store would need accurate catalog data, real variant handling, accessible filter controls, and verified cart behavior.

04 | Furniture Collection

Furniture concept — lifestyle collection banner and product listings.

Category-specific needs

The Furniture page reuses the same design language while accommodating products with different price points, dimensions, materials, and purchase considerations. The banner gives the collection a strong visual identity; the catalog below supports scanning and comparison.

Featured catalog patterns

- **Category navigation:** Sofas, Chairs, Tables, Storage, Beds, Benches, and Outdoor Furniture.
- **Price and material filtering:** proposed controls for customers comparing larger furniture pieces.
- **Product cards:** consistent image framing, product names, prices, ratings, and promotional indicators.
- **Variant cues:** color swatches suggest finish or upholstery choices that could be linked to real variants.
- **Shared shopping controls:** favorite and Add to Cart patterns remain familiar across category pages.

Further product-detail requirements

For a production furniture store, the product detail page should communicate dimensions, materials, assembly requirements, delivery coverage, shipping costs, stock status, variant availability, and return terms. These details are not validated by the category-page visual and would need to be supplied and confirmed before launch.

05 | Visual System & Shopping Journey

Visual direction

The visual system pairs a warm neutral palette with dark text and natural wood tones. Lifestyle photography supplies emotional context, while restrained interface chrome keeps attention on the products. A consistent spacing rhythm and repeated card layout help the three pages feel like one storefront.

Color role	Intended use
Warm cream / off-white	Main page backgrounds and negative space
Walnut / deep brown	Brand accents, dark text areas, and warm visual anchors
Muted gold / sand	Small highlights, badges, dividers, and secondary accents
Charcoal	Promotional strip, primary text, and contrast

Proposed customer journey

- **Arrive:** customer lands on the homepage and understands the brand and major product areas.
- **Explore:** customer selects Home Decor or Furniture from the main navigation or a collection tile.
- **Narrow:** customer uses category links, price/material/color filters, and sorting to refine results.
- **Compare:** customer scans imagery, names, prices, ratings, and available options.
- **Purchase:** customer selects a product and proceeds through the real product detail page and checkout flow.

These are intended UX patterns, not measured outcomes. No conversion lift, revenue impact, or usability-test result is claimed because the concept has not been validated with live users or production analytics.

06 | Proposed Nuvemshop Implementation

The visuals can serve as a design reference for a Nuvemshop storefront build or theme customization. The exact implementation path depends on the selected theme, platform capabilities, merchant requirements, and any integrations needed.

Suggested workstreams

Workstream	Scope
1. Discovery & content	Confirm brand assets, product taxonomy, product data, pricing, shipping rules, promotions, policies, and required pages.
2. Theme & design system	Map the concept to theme sections, global styles, typography, spacing, navigation, and reusable product-card patterns.
3. Catalog & collections	Configure real collections, product attributes, variants, images, filter values, and sorting behavior supported by the platform.
4. Commerce configuration	Set up payment, shipping, taxes where applicable, stock handling, cart, checkout, and transactional messaging.
5. Integrations	Identify any required analytics, marketing, customer support, fulfillment, or other third-party connections and validate their compatibility.
6. Responsive QA	Test desktop, tablet, and mobile layouts; keyboard navigation; form states; loading behavior; and key shopping journeys.
7. Launch readiness	Verify links, product data, policies, SEO metadata, tracking consent requirements, and operational ownership before release.

No live theme, store account, checkout, payment gateway, shipping provider, analytics tool, or external integration was accessed or configured as part of this visual concept.

07 | Deliverables, Quality Checks & Value

Concept deliverables

- Homepage visual direction for brand presentation and collection discovery.
- Home Decor category page concept with catalog and filtering patterns.
- Furniture category page concept with category-specific catalog organization.
- Consistent storefront design language across three related page types.
- Proposed implementation workstreams and production-readiness checklist.

Recommended quality-assurance checklist

- Verify all category links, product links, search, favorites, cart, filters, and sorting against real store data.
- Confirm product prices, stock, variants, promotions, ratings, shipping details, and policy text.
- Test mobile and tablet layouts, tap targets, text contrast, keyboard operation, and accessible labels.
- Validate checkout end to end using approved test methods and the merchant's configured payment/shipping options.
- Check page performance, image optimization, metadata, indexing settings, analytics, and privacy requirements.
- Run cross-browser checks and document any limitations imposed by the selected theme or integrations.

Professional value demonstrated

The concept demonstrates the ability to structure an online retail experience beyond a single landing page: a shared brand system, multiple category layouts, product-discovery patterns, and an implementation-oriented view of the work needed to move from visual direction to a maintainable store. It is intended to communicate practical e-commerce thinking and customization planning without implying unverified production results.

08 | Scope, Assumptions & Next Steps

Scope boundaries

- The included screenshots are generated visual concepts; they are not screenshots of a confirmed live store.
- Product names, prices, counts, review totals, badges, and promotional copy shown in the visuals are illustrative and must be replaced or verified.
- The visuals do not establish that code, theme files, product data, checkout, or integrations have been implemented or tested.
- No sales, conversion, performance, accessibility, or usability outcomes are claimed.
- No official partnership status or platform certification is claimed.

Recommended next steps

- Confirm the merchant's brand guidelines, product catalog, policies, and target customer needs.
- Select the Nuvemshop theme and determine which layouts can be achieved through native sections versus custom development.
- Create responsive page specifications and map all catalog fields and variants.
- Implement and validate the real shopping flow, integrations, and analytics.
- Conduct QA with merchant-approved test data, then prepare a controlled launch checklist.

Conclusion

LUMIÈRE HOME & LIVING presents a cohesive concept for a premium home and lifestyle storefront, spanning brand introduction and two product-heavy category experiences. The work provides a visual foundation and structured plan for a potential Nuvemshop implementation, with production readiness dependent on real catalog data, platform configuration, responsive development, and end-to-end testing.
